

EduMind AI Performance Testing

Date September 2026
Team ID xxxxxx
Project Name EduMind AI - Smart AI-Powered Learning Assistant
Maximum Marks 3 Marks

Step 1: Performance Testing Objective

Performance testing is used to check whether the EduMind AI application responds reliably to normal user interactions and whether the main learning features remain usable under expected test conditions.

Step 2: Test Scenarios

S.No	Test Scenario	Expected Result	Status
1	Open the EduMind AI homepage.	Homepage loads without application startup errors.	Pass
2	Submit a normal question through Q&A.;	Request is processed and an AI response is displayed when the AI service is available.	Pass*
3	Submit a concept for explanation.	Explanation response is generated and returned to the interface.	Pass*
4	Generate a quiz for a topic.	Quiz content is returned in the expected response format.	Pass*
5	Generate study notes for a topic.	Structured study notes are returned.	Pass*
6	Summarize learning content.	A concise summary is returned.	Pass*
7	Request a learning path for a topic and level.	Recommended learning sequence is returned.	Pass*
8	Submit an empty or invalid request.	Application should return a clear validation/error response instead of crashing silently.	Pass

Step 3: Performance Observations

The application is designed for responsive local web interaction. Actual AI response time depends on the external Gemini API, network connectivity and service availability. Therefore, AI-dependent tests are recorded as Pass* when the feature responds successfully under available API conditions.

Step 4: Testing Conclusion

The core EduMind AI workflow can be performance-tested through homepage loading, feature requests, response handling and validation/error handling. The application should be retested after major code, model or API configuration changes.
